Understanding the Product in Math

Defining the Product

A product, in mathematical terms, is the result of multiplying two or more numbers together. The numbers being multiplied are called factors. For example, in the equation $3 \times 4 = 12$, 3 and 4 are the factors, and 12 is the product. This fundamental

principle underlies numerous mathematical concepts.

Using Symbols and Notation

Multiplication is often represented by the multiplication sign ' $\times$ ' or an asterisk '*'. The use of parentheses to group factors and the implied multiplication of a number next to a variable (e.g., $5x$) are essential to mastering the notation used in equations. Methods for Finding the Product

Unlocking the Mystery: How to Find the Product in Math

Ever stared at a math problem, a string of numbers separated by a familiar symbol, and felt a tiny bit lost? That symbol, often a graceful 'x' or a discreet dot, signifies one of the most fundamental operations in mathematics: multiplication. And when we perform this operation, the result we get is called the "product." Sounds simple enough, right? But understanding *how* to find this product is the key that unlocks a vast universe of mathematical concepts, from basic arithmetic to complex algebra. Whether you're a student navigating elementary school math, a seasoned problem-solver revisiting the basics, or simply curious about the language of numbers, this guide is for you. We're going to delve deep into the world of finding the product, exploring

different methods, understanding its importance, and even touching upon its applications. So, grab your favorite thinking cap, and let's embark on this mathematical adventure!

What Exactly is the "Product" in Math?

Before we dive into the "how," let's solidify our understanding of the "what." In multiplication, the numbers being multiplied are called ****factors****. The answer, the result of multiplying these factors together, is the ****product****. Think of it like this: if you have 3 bags, and each bag contains 4 apples, you're essentially performing the multiplication 3×4 . Here, 3 and 4 are the factors. The total number of apples you have is the product, which is 12. So, the product of 3 and 4 is 12. It's crucial to remember that the term "product" specifically refers to the ***result*** of multiplication. You won't find a "product" when you add, subtract, or divide numbers; those operations have their own unique names for their results (sum, difference, quotient).

The Building Blocks: How to Find the Product with Basic Multiplication

For most of us, the journey of finding a product begins

with mastering basic multiplication facts. This involves memorizing or systematically calculating the results of multiplying single-digit numbers.

Multiplication Tables: Your First Best Friend

The most common and effective way to learn basic multiplication is through multiplication tables. You've likely seen them – grids that show the products of numbers from 1 to 10 (or even 12). Practicing these tables diligently is a cornerstone of mathematical fluency. When you encounter a problem like 7×8 , and you've practiced your 7s table, you can instantly recall that the product is 56.

Repeated Addition: The Conceptual Foundation

While multiplication tables are about speed and recall, understanding **why** they work is equally important. Multiplication is essentially a shortcut for repeated addition. To find the product of 5×3 , you can add 5 three times ($5 + 5 + 5 = 15$) or add 3 five times ($3 + 3 + 3 + 3 + 3 = 15$). The product is 15. This concept helps bridge the gap between addition and multiplication, making it easier to grasp for younger learners.

Strategies for Larger Numbers: Beyond Single Digits

Once you're comfortable with single-digit multiplication, the next step is to tackle larger numbers. Here are some common and effective strategies:

- The Standard Algorithm (Long Multiplication):** This is the method most of us learned in school. It involves multiplying each digit of one number by each digit of the other number, carrying over when necessary, and then adding the partial products. For example, to find the product of 23×14 :
 - * Multiply 23 by 4 (the ones digit of 14): $23 \times 4 = 92$.
 - * Multiply 23 by 10 (the tens digit of 14, remembering its place value): $23 \times 10 = 230$.
 - * Add the partial products: $92 + 230 = 322$. The product of 23 and 14 is 322. This method is systematic and works for any two multi-digit numbers.
- Area Model (Box Method):** This visual approach is fantastic for understanding place value and breaking down multiplication. To find the product of 23×14 :
 - * Break down each number into its place values: 23 becomes $20 + 3$, and 14 becomes $10 + 4$.
 - * Create a grid (a 2×2 box for two two-digit numbers).
 - * Multiply the numbers corresponding to each box:
 - * $20 \times 10 = 200$
 - * $20 \times 4 = 80$
 - * $3 \times 10 = 30$
 - * $3 \times 4 = 12$
 - * Add the products from all the boxes: $200 + 80 + 30 + 12 = 322$. The area

model provides a clear visual representation of how the standard algorithm works and is excellent for reinforcing the concept of multiplying tens by tens, tens by ones, and so on. **Distributive Property:** This algebraic property is the foundation of both the standard algorithm and the area model. It states that $a(b + c) = ab + ac$. For example, to find the product of 7×15 : You can rewrite 15 as $10 + 5$. So, $7 \times 15 = 7 \times (10 + 5)$. Using the distributive property, this becomes $(7 \times 10) + (7 \times 5)$. Calculate the products: $70 + 35 = 105$. The product of 7 and 15 is 105. This property is incredibly useful for mental math and understanding more complex algebraic manipulations.

Beyond the Basics: Finding Products in Different Mathematical Contexts

The concept of the product extends far beyond simple arithmetic. It's a fundamental operation that appears in various branches of mathematics.

Algebra: The Product of Variables and Expressions

In algebra, we often work with **variables** (symbols representing unknown numbers) and **expressions** (combinations of numbers, variables, and operations).

Finding the product in algebra involves multiplying these elements together. * **Product of Monomials:**
A monomial is a single term (e.g., $3x$, $5y^2$, $-2ab$). To find the product of monomials, you multiply their coefficients (the numerical parts) and add the exponents of the same variables. * Example: $(2x^3) * (4x^2) = (2 * 4) * (x^3 * x^2) = 8 * x^{(3+2)} = 8x^5$. The product here is $8x^5$. * **Product of Polynomials:** A polynomial has multiple terms (e.g., $x + 2$, $3y^2 - 5y + 1$). Finding the product of polynomials can involve using methods like the distributive property (often called FOIL for binomials - First, Outer, Inner, Last) or the standard algorithm adapted for polynomials. * Example (FOIL): To find the product of $(x + 2)(x + 3)$: * First: $x * x = x^2$ * Outer: $x * 3 = 3x$ * Inner: $2 * x = 2x$ * Last: $2 * 3 = 6$ * Combine like terms: $x^2 + 3x + 2x + 6 = x^2 + 5x + 6$. The product is $x^2 + 5x + 6$.

Fractions and Decimals: Products in the World of Non-Whole Numbers

Finding the product of fractions and decimals follows specific rules, but the underlying concept of multiplication remains the same. * **Product of Fractions:** To find the product of two fractions, you multiply the numerators (the top numbers) together to get the new numerator and multiply the denominators

(the bottom numbers) together to get the new denominator. * Example: $(2/3) * (4/5) = (2 * 4) / (3 * 5) = 8/15$. The product is 8/15. ***Product of Decimals:** When multiplying decimals, you multiply them as if they were whole numbers and then place the decimal point in the product. The number of decimal places in the product is equal to the total number of decimal places in the original numbers. * Example: $1.2 * 0.5$ * Multiply $12 * 5 = 60$. * 1.2 has one decimal place, and 0.5 has one decimal place, for a total of two. * Place the decimal point two places from the right in 60: 0.60 or simply 0.6. The product is 0.6.

Geometry: The Product of Dimensions

The concept of a product is also deeply embedded in geometry, often representing areas and volumes. *

****Area of a Rectangle:**** The area of a rectangle is found by multiplying its length and width. * If a rectangle has a length of 5 units and a width of 3 units, its area is $5 \text{ units} * 3 \text{ units} = 15 \text{ square units}$. The product of the dimensions gives us the area. *

****Volume of a Rectangular Prism:**** The volume of a rectangular prism (like a box) is found by multiplying its length, width, and height. * If a box has dimensions of 4 cm, 2 cm, and 3 cm, its volume is $4 \text{ cm} * 2 \text{ cm} * 3 \text{ cm} = 24 \text{ cubic centimeters}$. The product of these three

dimensions yields the volume.

Why is Finding the Product So Important?

The ability to find the product is not just a skill to pass math tests; it's a fundamental building block for countless mathematical and real-world applications. *

****Quantifying Growth and Change:**** Multiplication is essential for understanding how things grow over time, such as compound interest or population growth.

* ****Calculating Quantities:**** From calculating the total cost of multiple items to determining the amount of paint needed for a wall, multiplication helps us find precise quantities. * ****Scaling and Proportions:****

Understanding how to multiply or divide by a factor is crucial for working with ratios and proportions, which are used in everything from cooking to engineering. *

****Foundation for Advanced Math:**** As we've seen, multiplication is a cornerstone of algebra, calculus, and many other advanced mathematical fields.

Without a solid grasp of finding products, tackling these higher-level concepts becomes incredibly challenging. * ****Problem-Solving:**** Many real-world problems can be translated into mathematical equations that involve multiplication. The ability to find the product is a key tool in solving these

problems.

Tips for Mastering the Art of Finding the Product

Like any skill, becoming proficient at finding products takes practice and understanding. Here are some tips to help you along the way: 1. ****Practice Regularly:**** Consistency is key. Dedicate time each day to practice multiplication facts and problem-solving. 2.

****Understand the "Why":**** Don't just memorize. Strive to understand the underlying concepts, like repeated addition and the distributive property. This deeper understanding makes it easier to apply the methods.

3. ****Use Visual Aids:**** For younger learners or those who benefit from visual learning, methods like the area model can be incredibly helpful. 4. ****Break Down Complex Problems:**** For larger numbers or algebraic expressions, break the problem down into smaller, manageable steps. 5. ****Check Your Work:**** After finding a product, especially with the standard algorithm, take a moment to review your steps.

Estimating the answer beforehand can also help you catch errors. 6. ****Utilize Resources:**** Don't hesitate to use multiplication charts, online calculators (for checking, not for initial learning!), or seek help from teachers or tutors if you're struggling.

By understanding the different methods, appreciating its conceptual underpinnings, and practicing diligently, you can confidently navigate any problem that requires you to multiply. So, the next time you see those familiar factors lined up, ready to be combined, remember the magic of the product and the vast possibilities it unlocks. Keep practicing, keep exploring, and you'll find that the world of mathematics, and the products within it, becomes an exciting and accessible place.

Finding a product in mathematics is a foundational yet profound challenge that lies at the heart of many analytical and applied disciplines. At its core, a product refers to the result of multiplying two or more mathematical entities—be they numbers, vectors, functions, or abstract algebraic structures. Understanding how to locate and interpret these

products is essential not only for solving equations but also for advancing knowledge in fields ranging from physics to economics.

Understanding the Concept of Product in Mathematics

In mathematics, the product is more than a simple multiplication; it embodies a relationship between quantities that captures how they combine or interact. For real numbers, the product is straightforward—the result of combining magnitudes—but in vector spaces, it extends to the dot product, which reveals angle and alignment. In calculus, products appear in integrals and derivatives, forming the basis of more complex operations like integration by parts. Similarly, in linear algebra, matrix products encode transformations, enabling the modeling of dynamic systems. Recognizing what constitutes a product—whether scalar, vector, or function-based—forms the foundation for accurate identification and manipulation.

Key Strategies for Locating

Mathematical Products

To find a product, clarity in context and structure is crucial. Begin by identifying the types of mathematical objects involved: are they numbers, variables, vectors, or functions? For instance, locating the product of two numbers is direct, but identifying the dot product of two vectors requires understanding orthogonality and projection. In algebraic expressions, products often reside within parentheses or are implied through multiplication symbols or implied by context. When dealing with functions, the product may appear as a composite expression, such as $f(x) \cdot g(x)$, demanding careful parsing. Leveraging mathematical notation and notation systems—like braces for vectors or operator symbols—helps isolate and extract the product component efficiently.

Practical Applications Across Disciplines

Products are not abstract curiosities but powerful tools with wide-ranging applications. In geometry, the area of a rectangle is a product of its length and width, while in physics, force equals mass times acceleration—a quintessential vector product. In

statistics, covariance measures how two variables co-vary through their product terms, informing correlation analysis. Economic models use product functions to describe output based on inputs like labor and capital. Even in computer science, dot products enable machine learning algorithms to compute similarity between data points. These real-world uses underscore the necessity of mastering product identification as a pathway to problem-solving and innovation.

Benefits and Long-Term Value

Accurately identifying mathematical products enhances problem-solving precision and deepens conceptual understanding. It enables students and professionals alike to manipulate equations confidently, derive meaningful relationships, and model complex systems. This skill fosters analytical thinking, helping to break down problems into manageable components. In research and development, precise use of products supports rigorous proof construction and validation of hypotheses. Moreover, as mathematical modeling grows in importance across industries, the ability to locate and compute products becomes indispensable for innovation and decision-making.

Looking Ahead: The Evolving Role of Products in Mathematics

As mathematics continues to evolve, the concept of product adapts to new paradigms. Emerging fields like quantum computing rely on tensor products to describe entangled states, while data science uses high-dimensional inner products for dimensionality reduction and pattern recognition. Artificial intelligence leverages product structures in neural networks through weighted summations and activation functions. The future promises even deeper integration of product concepts into interdisciplinary research, augmented by computational tools that automate and visualize product-based operations. For learners and practitioners, staying attuned to these developments ensures sustained relevance and mastery in an ever-expanding mathematical landscape.

the Product in Mathematics

Among these, multiplication stands out as a cornerstone, and its result – the product – is a concept that permeates nearly every branch of mathematical study, from elementary arithmetic to advanced calculus. But what exactly does it mean to "find the product," and how can we effectively navigate the process? This comprehensive guide will delve into the heart of mathematical multiplication, demystifying the steps involved, exploring various scenarios, and equipping you with the knowledge and strategies to confidently find the product in any mathematical context.

Understanding the product is not merely about performing a calculation; it's about grasping the essence of combining quantities. Whether you're a student grappling with multiplication tables, a seasoned professional dealing with complex equations, or simply someone looking to refresh their mathematical skills, this article will serve as your definitive resource. We'll cover everything from the basic definition to practical applications, ensuring you're well-prepared to tackle any problem involving

finding the product.

What is a Product in Mathematics?

At its core, the product in mathematics is the result of multiplying two or more numbers, quantities, or expressions. It represents the outcome of repeated addition or the scaling of one quantity by another. The symbol for multiplication is typically an asterisk (*), a dot ($\cdot$), or an 'x' ($\times$). For instance, in the expression **3 $\times$ 4**, the numbers 3 and 4 are called factors, and the result, 12, is the product.

Think of it this way: if you have 3 groups of items, and each group contains 4 items, finding the product tells you the total number of items you have. $3 \text{ groups} \times 4 \text{ items/group} = 12 \text{ items}$. This fundamental concept extends far beyond simple integers.

The Building Blocks: Finding the Product of Integers

For beginners, mastering the product of integers is the first crucial step. This involves understanding multiplication tables and applying the rules of multiplication for positive and negative numbers.

Multiplication Tables: Your Foundation

The memorization of multiplication tables, from 1×1 to 12×12 (or beyond, depending on the curriculum), is paramount. These tables provide instant recall for the products of single-digit numbers, forming the basis for more complex calculations. Consistent practice and using mnemonic devices can significantly aid in mastering these tables. Once internalized, they act as a mental shortcut, allowing you to quickly find the product of smaller numbers.

Multiplying Larger Integers: The Algorithm

When dealing with integers larger than single digits, a systematic algorithm is employed. This typically involves:

1. **Setting up the problem:** Align the numbers vertically, with the larger number on top.
2. **Multiplying by each digit of the bottom number:** Starting from the rightmost digit of the bottom number, multiply it by each digit of the top number, carrying over any tens to the next column.
3. **Shifting and repeating:** For each subsequent digit of the bottom number, repeat the multiplication process, but shift the result one place to the left (or add a zero in the units column).

4. **Summing the partial products:** Add all the resulting partial products together to obtain the final product.

Example: Finding the product of 234 and 56.

First, multiply 234 by 6 (the units digit of 56): $234 \times 6 = 1404$.

Next, multiply 234 by 5 (the tens digit of 56), remembering to add a zero in the units place: $234 \times 50 = 11700$.

Finally, add the partial products: $1404 + 11700 = 13104$. Therefore, the product of 234 and 56 is 13104.

The Role of Signs: Positive and Negative Integers

When finding the product of numbers with signs, specific rules apply:

1. **Positive $\times$ Positive = Positive** (e.g., $5 \times 7 = 35$)
2. **Negative $\times$ Negative = Positive** (e.g., $-5 \times -7 = 35$)
3. **Positive $\times$ Negative = Negative** (e.g., $5 \times -7 = -35$)
4. **Negative $\times$ Positive = Negative** (e.g., $-5 \times 7 = -35$)

Essentially, if the signs are the same, the product is positive. If the signs are different, the product is negative. This principle is crucial when dealing with algebraic expressions.

Extending the Concept: Products of Decimals and Fractions

The principles of finding the product extend seamlessly to decimals and fractions, albeit with slightly different procedural nuances.

Finding the Product of Decimals

To find the product of decimal numbers, you can follow these steps:

1. **Ignore the decimal points:** Treat the numbers as whole integers and multiply them as usual.
2. **Count the total decimal places:** Count the total number of digits to the right of the decimal point in all the numbers being multiplied.
3. **Place the decimal point:** In the resulting product, count from the rightmost digit and place the decimal point so that it has the same number of digits as you counted in step 2.

Example: Finding the product of 2.5 and 1.3.

Multiply 25 by 13: $25 \times 13 = 325$.

There is one decimal place in 2.5 and one decimal place in 1.3, for a total of two decimal places.

Place the decimal point in 325 so that there are two decimal places: 3.25. Therefore, the product of 2.5 and 1.3 is 3.25.

Finding the Product of Fractions

Multiplying fractions is remarkably straightforward:

1. **Multiply the numerators:** Multiply the top numbers of the fractions together.
2. **Multiply the denominators:** Multiply the bottom numbers of the fractions together.
3. **Simplify:** Reduce the resulting fraction to its simplest form by dividing both the numerator and denominator by their greatest common divisor.

Example: Finding the product of $\frac{1}{2}$ and $\frac{3}{4}$.

Multiply the numerators: $1 \times 3 = 3$.

Multiply the denominators: $2 \times 4 = 8$.

The resulting fraction is $\frac{3}{8}$. Since 3 and 8 have no common divisors other than 1, the fraction is already in its simplest form. Thus, the product of $\frac{1}{2}$ and $\frac{3}{4}$ is $\frac{3}{8}$.

Mixed Numbers and Products

When dealing with mixed numbers, it's essential to convert them into improper fractions before multiplying. For example, to find the product of $1\frac{1}{2}$ and $2\frac{3}{4}$:

1. Convert $1\frac{1}{2}$ to an improper fraction: $(1 \times 2) + 1 / 2 = 3/2$.
2. Convert $2\frac{3}{4}$ to an improper fraction: $(2 \times 4) + 3 / 4 = 11/4$.
3. Multiply the improper fractions: $(3/2) \times (11/4) = (3 \times 11) / (2 \times 4) = 33/8$.
4. Convert the improper fraction back to a mixed number if desired: $33 \div 8 = 4$ with a remainder of 1, so $4\frac{1}{8}$.

The Power of Products in Algebra

Algebra introduces variables and expressions, transforming the concept of finding the product into a more dynamic process. Here, the product involves multiplying algebraic terms, which can include numbers, variables, and exponents.

Multiplying Monomials

A monomial is an algebraic expression consisting of a

single term. To find the product of two or more monomials:

1. **Multiply the coefficients:** Multiply the numerical coefficients together.
2. **Multiply the variables:** Multiply the variables together, adding their exponents if the bases are the same.

Example: Finding the product of $3x^2y$ and $4xy^3$.

Multiply the coefficients: $3 \times 4 = 12$.

Multiply the variables: $x^2 \times x^1 = x^3$ (adding exponents $2+1$); $y^1 \times y^3 = y^4$ (adding exponents $1+3$).

Combine the results: $12x^3y^4$. Therefore, the product is $12x^3y^4$.

Multiplying Polynomials

A polynomial is an expression containing multiple terms. Finding the product of polynomials requires a more extensive application of the distributive property.

The Distributive Property: Unpacking the Multiplication

The distributive property states that $a(b + c) = ab +$

ac. This principle is extended to multiplying a monomial by a binomial, a binomial by a binomial, and so on.

Monomial by Binomial

Example: Find the product of $2x(3x + 5)$.

Distribute $2x$ to each term inside the parentheses:

$$(2x \times 3x) + (2x \times 5) = 6x^2 + 10x.$$

Binomial by Binomial (FOIL Method)

The FOIL method is a mnemonic device for multiplying two binomials: First, Outer, Inner, Last.

Example: Find the product of $(x + 2)(x + 3)$.

1. **First:** $x \times x = x^2$
2. **Outer:** $x \times 3 = 3x$
3. **Inner:** $2 \times x = 2x$
4. **Last:** $2 \times 3 = 6$

Combine and simplify: $x^2 + 3x + 2x + 6 = x^2 + 5x + 6$.

General Polynomial Multiplication

For polynomials with more than two terms, the distributive property is applied iteratively. Each term in the first polynomial is multiplied by each term in the

second polynomial, and then all resulting terms are combined and simplified.

Example: Find the product of $(x^2 + x + 1)(x - 2)$.

Multiply x^2 by $(x - 2)$: $(x^2 \times x) - (x^2 \times 2) = x^3 - 2x^2$.

Multiply x by $(x - 2)$: $(x \times x) - (x \times 2) = x^2 - 2x$.

Multiply 1 by $(x - 2)$: $(1 \times x) - (1 \times 2) = x - 2$.

Combine all the results: $(x^3 - 2x^2) + (x^2 - 2x) + (x - 2)$.

Simplify by combining like terms: $x^3 + (-2x^2 + x^2) + (-2x + x) - 2 = x^3 - x^2 - x - 2$.

Practical Applications of Finding the Product

The ability to find the product is not confined to textbook exercises; it's a fundamental skill with widespread applications in real-world scenarios.

Financial Calculations

Calculating interest on loans or investments, determining profit margins, and budgeting all involve multiplication. For instance, to find the total interest earned on a principal amount, you multiply the principal by the interest rate and the time period.

Area and Volume Calculations

In geometry, finding the area of rectangles (length $\times$ width) and the volume of rectangular prisms (length $\times$ width $\times$ height) directly relies on calculating products. This is essential in fields like construction, engineering, and design.

Rate and Distance Problems

When you know a speed (rate) and a time, you can find the distance traveled by multiplying the rate by the time (distance = rate $\times$ time). This is applicable in physics, transportation, and everyday travel planning.

Data Analysis and Statistics

In statistics, products are used in calculating weighted averages, variance, and many other statistical measures. Understanding how different factors contribute to an overall outcome often involves multiplication.

Computer Science and Programming

Algorithms and data structures heavily rely on multiplication for various computations, from array indexing to complex simulations. Understanding the efficiency of operations in computing often hinges on

the complexity of multiplications involved.

Tips and Strategies for Success

Finding the product efficiently and accurately is a skill that can be honed with practice and the right approach.

1. **Master the Basics:** Ensure a solid understanding of multiplication tables and the rules for signs.
2. **Break Down Complex Problems:** For larger numbers or complex expressions, decompose them into smaller, manageable steps.
3. **Utilize Estimation:** Before performing an exact calculation, estimate the product to get a sense of the expected magnitude. This helps in identifying potential errors.
4. **Practice Regularly:** Consistent practice is key to building fluency and speed.
5. **Understand the Properties of Multiplication:** Commutative ($a \times b = b \times a$), Associative ($a \times (b \times c) = (a \times b) \times c$), and Distributive properties can simplify calculations.
6. **Use Tools Wisely:** While calculators are helpful, try to perform calculations manually or with mental math as much as possible to reinforce understanding.

Questions & Answers About how to find a product in math

No	Question	Answer
1	What does it mean to 'find the product' in math?	Finding the product in math means performing multiplication. It's the result you get when you multiply two or more numbers together.
2	Is finding the product just for basic multiplication, or does it apply to more advanced math?	It applies across the board! From simple multiplication of whole numbers to complex operations with fractions, decimals, polynomials, and even matrices, the concept of 'product' remains the result of multiplication.
3	How do I find the product of two fractions?	To find the product of two fractions, you multiply their numerators together and their denominators together. Simplify the resulting fraction if possible.

4	What's the quickest way to find the product of two large numbers mentally?	For mental multiplication of large numbers, strategies like breaking numbers down (e.g., $35 \times 12 = 35 \times 10 + 35 \times 2$), using distributive property, or approximating can be very helpful.
5	Does 'product' refer to anything other than numbers in math?	Yes! In set theory, the 'Cartesian product' combines elements from two sets to form ordered pairs. In linear algebra, 'matrix product' is a specific way of multiplying matrices.
6	How can I check if I've found the correct product when multiplying decimals?	You can estimate the product by rounding the decimals to whole numbers and multiplying. Then, count the total number of decimal places in the original numbers and place that many in your calculated product.
